STAINLESS STEEL INFORMATION & DISCLAIMER

Stainless Steel Information

1. It is an often held belief that stainless steel is “maintenance free”. This however is not necesarily correct. All grades of stainless steel are susceptible to some form of staining or discolouration and periodic cleaning is required.
2. Stainless steel, if not properly maintained will discolour via a process called tea staining.
3. The staining rate and the required maintenance of stainless steel is relative to its environment, surface finish, design, grade of material and exposure.
4. For example,
a. An outside balustrade installation along Melbourne’s Bayside or Coastal Areas would experience a faster rate of tea staining due to the environmental conditions and would therefore require more frequent maintenance than an indoor stairway balustrade installed in an inner Melbourne suburb of say - Blackburn.
b. Due to the relative smoothness of the surface finish, a stainless steel component with a satin finish will display signs of tea staining much sooner than a highly polished component of the same grade.
c. Designs that incorporate poor run off (rainwater / washing water / etc) provide areas for stagnant water to collect which may increase the likelihood of tea staining.
5. We therefore suggest that you enquire about appropriate products available for the cleaning and maintenance of stainless steel.
